Sections 01 & 03

Project Introduction

Project Type:

Online Food & Drink Ordering System

Project Overview:

- In this project, your group will develop a web-based system to manage online food and drink orders for cafeterias located in the UTM-JB area.
- The system provides end-to-end online ordering processes, allowing customers to place orders that include multiple menu items (food and beverages) through a web-based interface (accessible via desktop and mobile devices).

Instruction:

You are required to **select ONE suitable case study** related to a cafeteria or food service provider within the UTM-JB area (e.g., campus cafeteria, food court stall, beverage kiosk, or small restaurant). Based on your selected case study, **prepare a Project Introduction** for your system proposal. You may use and customize the given project introduction ideas, [ProjectIntroIdeas.txt](#)

Basic Database Table Design

- The system must include the following main tables:
 - 1) **users** – stores basic users' information (admin & customers)
 - 2) **orders** – store orders made by customers
 - 3) **menus** – store menu items that consists of foods and drinks

Instruction:

You are required to design an **Entity Relationship Diagram (ERD)** based on the tables above. You may add additional tables as necessary to support system requirements, while ensuring proper data relationships, integrity, and normalization.

Basic System Functions

- The system must support at least the following roles and functions:
 - 1) Admin/Vendor**
 - Manage menu items (create, update, delete)
 - View and manage customer orders
 - 2) Customer**
 - Place orders
 - View order status/history

Instruction:

You are required to propose and implement additional system functions to make the application more comprehensive, user-friendly, and aligned with real-world web-based food ordering systems.

Test Data Preparation

- Create a database using the following naming convention: `cpad_sectNo_groupName`
- If you are from section 1 and your group name is “Alpha” then the database name would be: `cpad_01_alpha`
- Grant full privileges on the database to the following user account:
 - Username: `cpad`
 - Password: `cpadPassword`
- Based on your ERD, create all required tables and insert minimum sample data as follows:
 - Foods: **at least 5 items**
 - Drinks: **at least 5 items**
 - Customer Orders: **at least 15 orders** created by **at least 5 different customers**

Group & Submission Guidelines

- Each group must consist of 4 to 5 students.
- Back up your database using one of the following commands:

```
mariadb-dump --user=cpad --password cpad_sectNo_groupName > cpad_sectNo_groupName.sql
```

or

```
mysqldump --user=cpad --password cpad_sectNo_groupName > cpad_sectNo_groupName.sql
```
- The group leader must submit the following:
 - Project proposal (including: project title, team members, project introduction, proposed system functions, and ERD)
 - A compressed file (*.zip) containing the database backup file (`cpad_sectNo_groupName.sql`)
