1. Introduction

1.1. Background of the Case Study

*(*The selected case study is ???, a campus-based food service provider that offers a variety of meals and beverages to students and staff. Currently, the cafeteria operates primarily through walk-in orders, where customers queue at different stalls to place their orders. Some vendors also accept orders via messaging applications such as WhatsApp during peak hours.*

However, this approach is not centralized, and each vendor manages orders independently. Customers often need to physically visit the cafeteria to check menu availability and place orders, which can be inconvenient, especially during busy periods.)

1.2. Problem Statement

*(*The current ordering process at ??? faces several issues:*

- Long waiting time during peak hours due to manual order processing and queues.*
- Lack of centralized system, causing inefficiency as each stall handles orders separately.*
- Limited accessibility, where customers must be physically present or rely on informal messaging methods.*
- Order inaccuracies, especially when handling multiple items or large orders manually.*
- No proper record management, making it difficult for vendors to track sales and analyze demand.*

These challenges reduce operational efficiency and negatively impact customer experience.)

1.3. Proposed Solution

*(*To address these issues, a web-based Online Food & Drink Ordering System is proposed. The system will allow customers to browse menus, select multiple food and beverage items, and place orders online through desktop or mobile devices.*

The system will provide a centralized platform where all cafeteria vendors can manage their menus and orders efficiently. Customers will be able to place orders in advance, reducing waiting time and improving convenience. Additionally, the system will automatically record order data, helping vendors manage and analyze their business operations.)

1.4. Project Scope

*(*The proposed system will include the following functionalities:*

Customer Module:

- Browse menu items by vendor*
- Add multiple items to cart and place orders*
- View order summary and status*
- Vendor/Staff Module:*
- Manage menu items (add, update, delete)*
- View and process incoming orders*

Admin Module:

- Manage users and vendors*
- Monitor system operations*

The system will be accessible via web browsers on both desktop and mobile devices.)

1.5. Objectives of the Project

*(*The objectives of this project are:*

- To analyze the current ordering process and identify its limitations.*
- To design a web-based system architecture and database for managing online food and drink orders.*
- To develop an Online Food & Drink Ordering System that supports multiple menu item selection and centralized order management.*
- To implement and test the system to ensure it meets functional and usability requirements.)*

2. Proposed System Functionality

Module	Functionality	Descriptions	User
Authentication & Profile Module	User Registration	Allows new users to create account by providing details	Customer
	User Login	Authenticates registered users using their password and redirect them into respective interface based on their roles	All users
	User Logout	Ends the service for current user and redirect back to login page	All users
	Profile Management	Enables users to update their contact information such as their phone number to ensure accurate order communication.	All users
Customer Module	Menu Browsing	Allows customers to browse the digital menu and filters items by category.	Customer
	Cart Management	Allows customers to add multiple items to a cart, adjust quantities, and view a calculated subtotal before checking out.	Customer
	Place Orders	Allows customers to place orders directly through the system that captures the exact order date and time, and calculates the final total amount	Customer
	Order Tracking and History	Allows customers to view order status or history that can track active orders in real-time and review past purchases.	Customer
Vendor Module	Menu Management	Allows the vendor to manage menu items, including toggling status to hide sold out items from customers.	Vendor
	Order Dashboard	Provides a centralized interface to view and manage customer orders as they arrive.	Vendor
	Status Updating	Enables the vendor to manually update the progress of an order which instantly updates on the customer's end.	Vendor
	Sales and Records Viewing	A simple analytics feature that tallies up completed orders to help the vendor tracking	Vendor

		daily sales and identify popular menu items.
